

ABSTRACT

A system and method are provided for notifying a user about the occurrence of at least one predetermined event associated with an uninterruptible power supply (UPS) in operable communication with the system. The system comprises a worker module and a user interface module. The worker module determines whether the predetermined event has occurred and, responsive to said determination, the user interface module generates an user interface providing information relating to an operating parameter of the UPS. The user interface comprises at least one of a graphical portion and an alphanumeric portion.
